Introduction

Project background and context

SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against SpaceX for a rocket launch.

Problems you want to find answers

- -What factors determine if the rocket will land successfully?
- -The interaction amongst various features that determine the success rate of a successful landing.
- -What operating conditions needs to be in place to ensure a successful landing program.

Methodology

Executive Summary

- Data collection methodology:
 - Data was collected using SpaceX API and web scraping from Wikipedia.
- Perform data wrangling
 - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models

Data Collection

Description of how SpaceX Falcon9 data was collected.

- ✓ Data was first collected using SpaceX API (a RESTful API) by making a get request to the SpaceX API. This was done by first defining a series helper functions that would help in the use of the API to extract information using identification numbers in the launch data and then requesting rocket launch data from the SpaceX API url.
- ✓ Finally to make the requested JSON results more consistent, the SpaceX launch data was requested and parsed using the GET request and then decoded the response content as a Json result which was then converted into a Pandas data frame.
- ✓ Also performed web scraping to collect Falcon 9 historical launch records from a Wikipedia page titled List of Falcon 9 and Falcon Heavy launches of the launch records are stored in a HTML. Using BeautifulSoup and request Libraries, I extract the Falcon 9 launch HTML table records from the Wikipedia page, Parsed the table and converted it into a Pandas data frame

Data Collection – SpaceX API

- We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.
- The link to the notebook is https://github.com/Mumnur/Data-Science-capstoneproject/blob/main/Data%20Collect ion%20API.ipynb

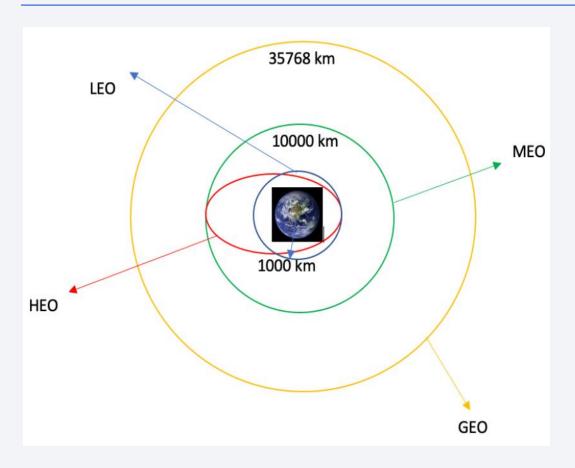

```
1. Get request for rocket launch data using API
          spacex url="https://api.spacexdata.com/v4/launches/past"
          response = requests.get(spacex url)
   2. Use json normalize method to convert json result to dataframe
In [12]:
           # Use json normalize method to convert the json result into a dataframe
           # decode response content as json
           static json df = res.json()
           # apply json normalize
           data = pd.json_normalize(static_json_df)
   3. We then performed data cleaning and filling in the missing values
In [30]:
           rows = data falcon9['PayloadMass'].values.tolist()[0]
           df rows = pd.DataFrame(rows)
           df rows = df rows.replace(np.nan, PayloadMass)
          data_falcon9['PayloadMass'][0] = df_rows.values
           data_falcon9
```

Data Collection - Scraping

- Performed web scraping to collect Falcon
 9 historical launch records from a
 Wikipedia using BeautifulSoup and
 request, to extract the Falcon 9 launch
 records from HTML table of the Wikipedia
 page, then created a data frame by parsing
 the launch HTML.
- The link to the notebook is https://github.com/Mumnur/Data-Science-capstoneproject/blob/main/Data%20Collect ion%20with%20Web%20Scraping .ipynb

```
static url = "https://en.wikipedia.org/w/index.php?title=List of Falcon 9 and Falcon Heavy 1;
        Next, request the HTML page from the above URL and get a response object
        TASK 1: Request the Falcon9 Launch Wiki page from its URL
        First, let's perform an HTTP GET method to request the Falcon9 Launch HTML page, as an HTTP response.
        # use requests.get() method with the provided static url
         # assign the response to a object
         response = requests.get(static_url)
        Create a BeautifulSoup object from the HTML response
        # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
         soup = BeautifulSoup(response.text, 'html')
        Print the page title to verify if the BeautifulSoup object was created properly
        # Use soup.title attribute
         soup.title
Out[8]: <title>List of Falcon 9 and Falcon Heavy launches - Wikipedia</title>
        TASK 2: Extract all column/variable names from the HTML table header
```

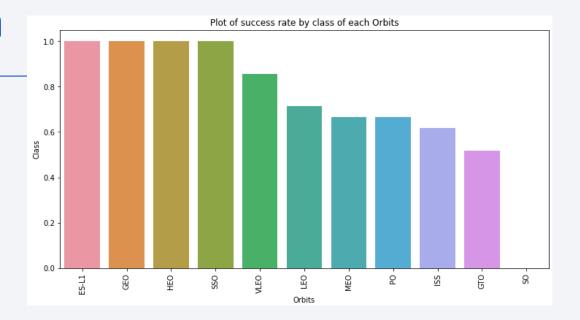

Data Wrangling

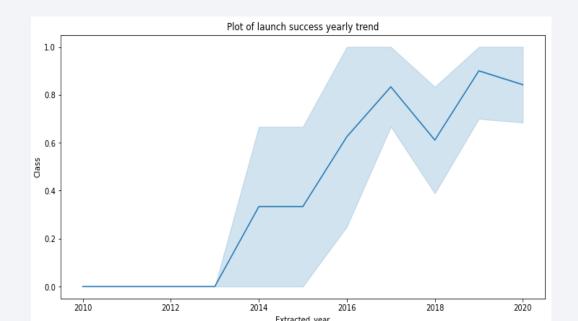

- We performed exploratory data analysis and determined the training labels.
- We calculated the number of launches at each site, and the number and occurrence of each orbits
- We created landing outcome label from outcome column and exported the results to csv.
- The link to the notebook is https://github.com/Mumnur/Data-Sciencecapstone-project/blob/main/EDA.ipynb

EDA with Data Visualization

- ✓ Performed data Analysis and Feature Engineering using Pandas and Matplotlib i.e.
 - > Exploratory Data Analysis
 - Preparing Data Feature Engineering
- ✓ Used scatter plots to Visualize the relationship between Flight Number and Launch Site, Payload and Launch Site, FlightNumber and Orbit type, Payload and Orbit type.
- ✓ Used Bar chart to Visualize the relationship between success rate of each orbit type
- ✓ Line plot to Visualize the launch success yearly trend.
- ✓ The link to the notebook is
 https://github.com/Mumnur/Data-Sciencecapstoneproject/blob/main/EDA%20with%20Data%2
 OVisualization.ipynb

EDA with SQL

- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
 - Display the names of the unique launch sites in the space mission

```
%sql SELECT DISTINCT LAUNCH_SITE as "Launch_Sites" FROM SPACEXTBL;
```

Display 5 records where launch sites begin with the string 'CCA'

```
%sql SELECT * FROM 'SPACEXTBL' WHERE Launch_Site LIKE 'CCA%' LIMIT 5;
```

Display the total payload mass carried by boosters launched by NASA (CRS)

```
%sql SELECT SUM(PAYLOAD_MASS__KG_) as "Total Payload Mass(Kgs)", Customer FROM 'SPACEXTBL' WHERE Customer = 'NASA (CRS)';
```

Display average payload mass carried by booster version F9 v1.1

```
%sql SELECT AVG(PAYLOAD_MASS__KG_) as "Payload Mass Kgs", Customer, Booster_Version FROM 'SPACEXTBL' WHERE Booster_Version LIKE 'F9 v1.1%';
```

• The link to the notebook is https://github.com/Mumnur/Data-Science-capstone-project/blob/main/EDA%20Using%20SQL.ipynb

Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
 - Are launch sites near railways, highways and coastlines.
 - Do launch sites keep certain distance away from cities.
- The link to the notebook is https://github.com/Mumnur/Data-Science-capstone-project/blob/main/Interactive%20Visual%20Analytics%20with%20Folium%20lab.ipynb

Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- The link to the notebook is https://github.com/Mumnur/Data-Science-capstone-project/blob/main/app.py

Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing. We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- The link to the notebook is https://github.com/Mumnur/Data-Science-capstone-project/blob/main/Machine%20Learning%20Prediction.ipynb

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

Flight Number vs. Launch Site

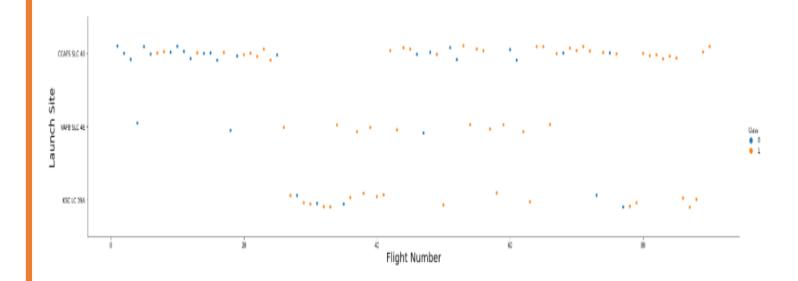

• From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

Payload vs. Launch Site

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

Success Rate vs. Orbit Type

 From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

Flight Number vs. Orbit Type

• The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

Payload vs. Orbit Type

• We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

Launch Success Yearly Trend

• From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

All Launch Site Names

Find the names of the unique launch sites

• We used 'SELECT DISTINCT' statement to return only the unique launch sites from the 'LAUNCH_SITE' column of the SPACEXTBL table

Task 1

Display the names of the unique launch sites in the space mission

```
%sql SELECT DISTINCT LAUNCH_SITE as "Launch_Sites" FROM SPACEXTBL
```

* sqlite:///my_data1.db

Launch_Sites

CCAFS LC-40

VAFB SLC-4E

KSC LC-39A

CCAFS SLC-40

Launch Site Names Begin with 'CCA'

Task 2 Display 5 records where launch sites begin with the string 'CCA' %sql SELECT * FROM 'SPACEXTBL' WHERE Launch_Site LIKE 'CCA%' LIMIT 5; * sqlite:///my_data1.db Done. Landing Date Booster_Version Launch_Site Payload PAYLOAD_MASS_KG_ Customer Mission_Outcome Orbit Outcome Dragon Spacecraft Qualification 04-06-CCAFS LC-Failure 18:45:00 F9 v1.0 B0003 0 LEO SpaceX Success 2010 (parachute) Unit Dragon demo flight C1, two Failure 08-12-CCAFS LC-LEO NASA (COTS) 15:43:00 F9 v1.0 B0004 0 Success 2010 CubeSats, barrel of Brouere cheese (ISS) NRO (parachute) 22-05-CCAFS LC-Dragon demo flight C2 525 NASA (COTS) F9 v1.0 B0005 07:44:00 Success No attempt 2012 (ISS) 08-10-CCAFS LC-LEO 00:35:00 F9 v1.0 B0006 SpaceX CRS-1 500 NASA (CRS) Success No attempt 2012 40 01-03-CCAFS LC-15:10:00 677 F9 v1.0 B0007 SpaceX CRS-2 NASA (CRS) Success No attempt 2013 40

Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Task 3
          Display the total payload mass carried by boosters launched by NASA (CRS)
In [17]:
          %sql SELECT SUM(PAYLOAD_MASS__KG_) as "Total Payload Mass(Kgs)", Customer FROM 'SPACEXTBL' WHERE Customer = 'NASA (CRS)';
         * sqlite:///my_data1.db
        Done.
Out[17]: Total Payload Mass(Kgs)
                                 Customer
                          45596 NASA (CRS)
```

Average Payload Mass by F9 v1.1

We calculated the average payload mass carried by booster version F9 v1.1 as

Task 4

2534.666666666665

Display average payload mass carried by booster version F9 v1.1

MDA

F9 v1.1 B1003

First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was

Task 5

List the date when the first successful landing outcome in ground pad was acheived.

Hint:Use min function

Successful Drone Ship Landing with Payload between 4000 and 6000

• Used 'Select Distinct' statement to return and list the 'unique' names of boosters with operators >4000 and < 6000 to only list booster with payloads btween 4000-6000 with landing outcome of 'Success (drone ship)

Task 6

F9 FT B1031.2 SES-11 / EchoStar 105

List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000

[26]:	6]: # %sql SELECT * FROM 'SPACEXTBL'						
[27]:	%sql SELECT DISTINCT Booster_Version, Payload FROM SPACEXTBL WHERE "Landing _Outcome" = "Success (drone ship)" AND PAYLOAD_MASSKG_ > 4000 AND PAYLO						
	* sqlite:///my_data1	.db					
:[27]:	Booster_Version	Payload					
	F9 FT B1022	JCSAT-14					
	F9 FT B1026	JCSAT-16					
	F9 FT B1021.2	SES-10					

Total Number of Successful and Failure Mission Outcomes

 Used the 'COUNT()' together with the 'GROUP BY' statement to return total number of missions outcomes

List the total number of successful and failure mission outcomes

Task 7

In [28]:	%sql SELECT "Mission_Outco	me", C	OUNT("Mission_Outcome") as Total FROM SPACEXTBL GROUP BY "Mission_Outcome";
	* sqlite:///my_data1.db		
Out[28]:	Mission_Outcome	Total	
	Failure (in flight)	1	
	Success	98	
	Success	1	
	Success (payload status unclear)	1	

Boosters Carried Maximum Payload

 Using a Subquerry to return and pass the Max payload and used it list all the boosters that have carried the Max payload of 15600kgs List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

%sql SELECT "Booster_Version",Payload, "PAYLOAD_MASS__KG_" FROM SPACEXTBL WHERE "PAYLOAD_MAS

* sqlite:///my_data1.db Done.

Booster_Version	Payload	PAYLOAD_MASSKG_
F9 B5 B1048.4	Starlink 1 v1.0, SpaceX CRS-19	15600
F9 B5 B1049.4	Starlink 2 v1.0, Crew Dragon in-flight abort test	15600
F9 B5 B1051.3	Starlink 3 v1.0, Starlink 4 v1.0	15600
F9 B5 B1056.4	Starlink 4 v1.0, SpaceX CRS-20	15600
F9 B5 B1048.5	Starlink 5 v1.0, Starlink 6 v1.0	15600
F9 B5 B1051.4	Starlink 6 v1.0, Crew Dragon Demo-2	15600
F9 B5 B1049.5	Starlink 7 v1.0, Starlink 8 v1.0	15600
F9 B5 B1060.2	Starlink 11 v1.0, Starlink 12 v1.0	15600
F9 B5 B1058.3	Starlink 12 v1.0, Starlink 13 v1.0	15600
F9 B5 B1051.6	Starlink 13 v1.0, Starlink 14 v1.0	15600
F9 B5 B1060.3	Starlink 14 v1.0, GPS III-04	15600
F9 B5 B1049.7	Starlink 15 v1.0, SpaceX CRS-21	15600

2015 Launch Records

• Used the 'subsrt()' in the select statement to get the month and year from the date column where substr(Date,7,4)='2015' for year and Landing_outcome was 'Failure (drone ship') and return the records nmatching the filter

Task 9

List the records which will display the month names, failure landing_outcomes in drone ship ,booster versions, launch_site for the months in year 2015.

Note: SQLLite does not support monthnames. So you need to use substr(Date, 4, 2) as month to get the months and substr(Date, 7,4) = '2015' for year.

```
%sql SELECT substr(Date,7,4), substr(Date, 4, 2), "Booster_Version", "Launch_Site", Payload, "PAYLOAD_MASS__KG_", "Mission_Outcome", "Landing _Outcome"

* sqlite://my_data1.db
Done.

* substr(Date,7,4) substr(Date, 4, 2) Booster_Version Launch_Site Payload PAYLOAD_MASS__KG_ Mission_Outcome Landing_Outcome
```

];	substr(Date, 7,4)	substr(Date, 4, 2)	Booster_version	Launcn_Site	Payload	PAYLOAD_MASSKG_	Wission_Outcome	Landing _Outcome
	2015	01	F9 v1.1 B1012	CCAFS LC-40	SpaceX CRS-5	2395	Success	Failure (drone ship)
	2015	04	F9 v1.1 B1015	CCAFS LC-40	SpaceX CRS-6	1898	Success	Failure (drone ship)

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Task 10

Rank the count of successful landing_outcomes between the date 04-06-2010 and 20-03-2017 in descending order.

%sql SELECT * FROM SPACEXTBL WHERE "Landing _Outcome" LIKE 'Success%' AND (Date BETWEEN '04-06-2010' AND '20-03-2017') ORDER BY Date DESC;

* sqlite:///my_data1.db Done.

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASSKG_	Orbit	Customer	Mission_Outcome	Landing _Outcome
19-02- 2017	14:39:00	F9 FT B1031.1	KSC LC-39A	SpaceX CRS-10	2490	LEO (ISS)	NASA (CRS)	Success	Success (ground pad)
18-10- 2020	12:25:57	F9 B5 B1051.6	KSC LC-39A	Starlink 13 v1.0, Starlink 14 v1.0	15600	LEO	SpaceX	Success	Success
18-08- 2020	14:31:00	F9 B5 B1049.6	CCAFS SLC- 40	Starlink 10 v1.0, SkySat- 19, -20, -21, SAOCOM 1B	15440	LEO	SpaceX, Planet Labs, PlanetIQ	Success	Success
18-07- 2016	04:45:00	F9 FT B1025.1	CCAFS LC-40	SpaceX CRS-9	2257	LEO (ISS)	NASA (CRS)	Success	Success (ground pad)
18-04- 2018	22:51:00	F9 B4 B1045.1	CCAFS SLC- 40	Transiting Exoplanet Survey Satellite (TESS)	362	HEO	NASA (LSP)	Success	Success (drone ship)
17-12- 2019	00:10:00	F9 B5 B1056.3	CCAFS SLC- 40	JCSat-18 / Kacific 1, Starlink 2 v1.0	6956	GTO	Sky Perfect JSAT, Kacific 1	Success	Success
16-11- 2020	00:27:00	F9 B5B1061.1	KSC LC-39A	Crew-1, Sentinel-6 Michael Freilich	12500	LEO (ISS)	NASA (CCP)	Success	Success
15-12-	15:36:00	F9 FT B1035.2	CCAFS SLC-	SpaceX CRS-13	2205	LEO	NASA (CRS)	Success	Success

All launch sites global map markers

Markers showing launch sites with color labels

Launch Site distance to landmarks

Pie chart showing the success percentage achieved by each launch site

Pie chart showing the Launch site with the highest launch success ratio

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

Classification Accuracy

 The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn cv.best score ,
              'DecisionTree':tree cv.best score ,
              'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm_cv.best_score_}
bestalgorithm = max(models, key=models.get)
print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree cv.best params )
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn cv.best params )
if bestalgorithm == 'LogisticRegression':
    print('Best params is :', logreg cv.best params )
if bestalgorithm == 'SupportVector':
    print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max_depth': 6, 'max_features': 'auto', 'min_samples_leaf': 2, 'min_samples_split': 5, 'splitter': 'random'}
```

Confusion Matrix

 The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes.
 The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.
